

Taken from http://svn.ez.no/svn/ezcomponents/trunk/Document/tests/files/wiki/creole/s_028_complete.txt

Top-level heading (1)

This a test for creole 0.1 (2)

This is a Subheading (3)

Subsub (4)

Subsubsub (5)

The ending equal signs should not be displayed:

Top-level heading (1)

This a test for creole 0.1 (2)

This is a Subheading (3)

Subsub (4)

Subsubsub (5)

You can make things **bold** or *italic* or ***both*** or ***both***.

Character formatting extends across line breaks: **bold, this is still bold. This line deliberately does not end in star-star.**

Not bold. Character formatting does not cross paragraph boundaries.

You can use `<` or `>`, give the link a `<` name.

Here's another sentence: This wisdom is taken from `<`.

Here's a external link without a description: `<`

Be careful that italic links are rendered properly: `<`

Free links without braces should be rendered as well, like <http://www.wikicreole.org/> and <http://www.wikicreole.org/users/~example>.

Creole1.0 specifies that <http://bar> and <ftp://bar> should not render italic, something like `foo:bar` should render as italic.

You can use this to draw a line to separate the page:

You can use lists, start it at the first column for now, please...

unnumbered lists are like

- item a
- item b
- **bold item c**

blank space is also permitted before lists like:

- item a
- item b
- item c

- item c.a

or you can number them

1. □
2. item 2
3. *italic item 3*
 1. item 3.1
 2. item 3.2

up to five levels

- 1
 - 2
 - 3
 - 4
 - 5
- You can have multiline list items
- this is a second multiline list item

You can use nowiki syntax if you would like do stuff like this:

```
Guitar Chord C:
```

```
| | --- | --- | --- |
| | -0- | --- | --- |
| | --- | --- | --- |
| | --- | -0- | --- |
| | --- | --- | -0- |
| | --- | --- | --- |
```

You can also use it inline nowiki `in a sentence` like this.

Escapes

Normal Link: <http://wikicreole.org/> - now same link, but escaped: `http://wikicreole.org/`

Normal asterisks: `**not bold**`

a tilde alone: `~`

a tilde escapes itself: `~xxx`

Creole 0.2

This should be a flower with the ALT text "this is a flower" if your wiki supports ALT text on images:

Creole 0.4

Tables are done like this:

header col1	header col2
col1	col2
you	can
	alien

also

align
it.

You can format an address by simply forcing linebreaks:

My contact dates:

Pone: xyz

Fax: +45

Mobile: abc

Creole 0.5

Header title

//not italic text//

italic text

Another header title

not bold text

bold text

Creole 1.0

If interwiki links are setup in your wiki, this links to the WikiCreole page about Creole 1.0 test cases: [□](#).
